Lab: Unit Testing and Error Handling

Problems for exercises and homework for the "JavaScript Advanced" course @ SoftUni.

Submit your solutions in the SoftUni judge system at https://judge.softuni.bg/Contests/2766/Unit-Testing-Lab.

Error Handling

1. Sub Sum

Write a function to sum a range of numeric elements from an array.

The function takes three parameters - the first is an array, the second is the start index and the third is the end index. Both indexes are inclusive. Have in mind that the array elements may not be of type Number and cast everything. Implement the following error handling:

- If the first element is not an array, return NaN
- If the **start index** is less than zero, consider its value to be a **zero**
- If the end index is outside the bounds of the array, assume it points to the last index of the array

Input / Output

Your function must take three parameters. As output, return the sum.

Examples

Input	Output
[10, 20, 30, 40, 50, 60], 3, 300	150
[1.1, 2.2, 3.3, 4.4, 5.5], -3, 1	3.3
[10, 'twenty', 30, 40], 0, 2	NaN
[], 1, 2	0
'text', 0, 2	NaN

2. Playing Cards

Create a JS factory function that returns a Card object holding the card's face and suit. Throw an error if the card is initialized with an invalid face.

- Valid card faces are: 2, 3, 4, 5, 6, 7, 8, 9, 10, J, Q, K, A
- Valid card suits are: S (♠), H (♥), D (♦), C (♣)

Both face and suit are expected as an uppercase string. The object also needs to have a toString() method that prints the card's face and suit as a string. Use the following UTF code literals to represent the suits:

- \u2660 Spades (♠)
- \u2665 Hearts (♥)
- \u2666 Diamonds (♦)
- \u2663 Clubs (♣)

Input / Output

The factory function takes two string parameters. The toString() method of the returned object must return a string.

Examples

Input	Output
'A', 'S'	A♣
'10', 'H'	10♥
'1', 'C'	Error

3. Deck of Cards

Write a function that takes a deck of cards as an array of strings and prints them as a sequence of cards (space separated). Use the solution from the previous task to generate the cards.

Print `Invalid card: \${card}` when an invalid card definition is passed as input.

Input / Output

The function takes an array of strings as a parameter. Print the list of cards as string, separated by space.

```
deckOfCards.js
function printDeckOfCards(cards) {
  function createCard (){
    // Use the solution from the previous task
 }
   // TODO
}
```

Examples

Sample Input	Sample Output
['AS', '10D', 'KH', '2C']	A♠ 10♦ K♥ 2♣
['5S', '3D', 'QD', '1C']	Invalid card: 1C

Unit Testing

You are required to submit only the unit tests for the object/function you are testing.

4. Sum of Numbers

Write tests to check the functionality of the following code:

```
sumNumbers.js
function sum(arr) {
    let sum = 0;
    for (let num of arr){
        sum += Number(num);
    return sum;
}
```

Your tests will be supplied with a function named 'sum()'. It should meet the following requirements:

- Take an array of numbers as an argument
- Return the sum of the values of all elements inside the array

5. Check for Symmetry

Write tests to check the functionality of the following code:

```
checkForSymmetry.js
function isSymmetric(arr) {
    if (!Array.isArray(arr)){
        return false; // Non-arrays are non-symmetric
    let reversed = arr.slice(0).reverse(); // Clone and reverse
    let equal = (JSON.stringify(arr) == JSON.stringify(reversed));
    return equal;
```

Your tests will be supplied with a function named 'isSymmetric()'. It should meet the following requirements:

- Take an array as an argument
- **Return false** for any input that isn't of the **correct type**
- Return true if the input array is symmetric
- Otherwise, return false

6. RGB to Hex

Write tests to check the functionality of the following code:

```
rgb-to-hex.js
function rgbToHexColor(red, green, blue) {
    if (!Number.isInteger(red) || (red < 0) || (red > 255)){
        return undefined; // Red value is invalid
    if (!Number.isInteger(green) || (green < 0) || (green > 255)){
```

```
return undefined; // Green value is invalid
    }
    if (!Number.isInteger(blue) || (blue < 0) || (blue > 255)){
        return undefined; // Blue value is invalid
    }
    return "#" +
        ("0" + red.toString(16).toUpperCase()).slice(-2) +
        ("0" + green.toString(16).toUpperCase()).slice(-2) +
        ("0" + blue.toString(16).toUpperCase()).slice(-2);
}
```

Your tests will be supplied with a function named 'rgbToHexColor()', which takes three arguments. It should meet the following requirements:

- Take three integer numbers, representing the red, green, and blue values of RGB color, each within the
- **Return** the same color in hexadecimal format as a **string** (e.g. **'#FF9EAA'**)
- Return undefined if any of the input parameters are of an invalid type or not in the expected range

7. Add / Subtract

Write tests to check the functionality of the following code:

```
addSubtract.js
function createCalculator() {
    let value = 0;
    return {
        add: function(num) { value += Number(num); },
        subtract: function(num) { value -= Number(num); },
        get: function() { return value; }
    }
```

Your tests will be supplied with a function named 'createCalculator()'. It should meet the following requirements:

- Return a module (object), containing the functions add(), subtract() and get() as properties
- Keep an internal sum that can't be modified from the outside
- The functions add() and subtract() take a parameter that can be parsed as a number (either a number or a string containing a number) that is added or subtracted from the internal sum
- The function **get()** returns the value of the internal sum
